FERMAX 3256 | SENAL DUOX regenerator

Brand: FERMAX

Reference: FERMAX 3256

DUOX signal regenerator. Device that allows the Duox signal to be regenerated in both directions, isolate sections of the installation, as well as extend distances and terminal capacity. Input and outputs are isolated against short circuits, load and signal reflections. It has 1 input and 1 output. The sections on both sides require their own power set ("filter+source"): the 1-out regenerator amplifies the data, but does not pass the power. Recommended use: extend distances, increase the number of terminals, isolate installation segments, isolate cable section changes in the same segment. Small in size, they allow their installation in electrical registers. They can be screwed directly to the wall. It is the first completely digital system in non-polarized two-wire technology.
